

Dear Rising Sixth Grader,

One of the things that you will probably enjoy about Middle School science is that I rarely assign homework. On the occasions that I do, it is for a very important reason.

In September, you will be starting physical science, an exciting class full of hands-on experimentation that will require a solid understanding of metric measurement. The most important thing that you can do to be ready for Middle School science is to become familiar with measurements and conversions in the metric system.

This packet goes through making measurements in centimeters and millimeters and converting your measurements between centimeters and meters. You will need a metric measuring tool (ruler, tape measure, or meter stick) at home for some of the exercises.

This work should not be burdensome or take a lot of time to complete, but it will provide a head start with metric measurement so that we can dive right into fun labs in the fall. If you have any questions, please contact me. I look forward to a great year in science with you!

Kind regards,

Dr. Treatman-Clark (Dr. T-C)
